

Ironvale Group* — executive summary

real customer · anonymized

a \$17M-revenue metals distributor · email + system of record connected **read-only** · findings from the last **30 days** · as of Jul 22, 2026

WHAT WE DID

- Connected the company's **email and system of record — read-only**; nothing we do can touch their systems.
 - Reconstructed **how the business actually runs** from its own history — 4 real workflows, mapped step by step, in its own vocabulary.
 - Ran **9 exception checks** against those workflows' own rhythms — every threshold learned from their history, not an industry average.
 - Verified the model on **held-out history**: it predicted the team's next action **94 of 100** times (baseline 85).
-

WHAT WE FOUND

- **Stalled work** in Coil Receiving & Splitting: 216 loads — work goes quiet partway through and never finishes (est. \$2,879)
 - **Missed follow-ups** in Inbound P2P Transfer Processing: 194 loads — the “New Barlow Invoice” email never went out (est. \$2,586)
 - **Excess back-and-forth** in Coil Receiving & Splitting: 56 loads — far more emails per order than the peer norm (est. \$1,887)
 - All time-costs together: **≈247 hours of ops work a month** tied up in these leaks (team size, their number: 5).
-

WHAT IT'S WORTH

- **\$9,892** of priced operational leak in the 30-day window — **≈\$118,704** a year at this run-rate.
- That prices **time only**. The bigger number is the reader's: **194 loads** where the “New Barlow Invoice” email never went out — multiply by what one is worth to the business.
- Every figure below traces to the actual email thread behind it — **the work is checkable**.

The pages that follow show the evidence: the priced leak ledger, the worst leak up close with its threads, and exactly how every number is computed.

FOUND LEAKING, ANNUALIZED

≈\$118,704 / year

\$9,892 of operational leak found at risk in the last 30 days — 526 priced instances across 9 automated checks. In time: ≈247 hours a month. Every instance traces to the email thread behind it.

These figures price **ops time only** — minutes at an hourly rate, not what a miss costs the business. When the step that slips is the one that bills or closes, the real exposure is a multiple of every number on this page: multiply the 194 never-sent loads by what a typical one is worth to you.

WHERE IT LEAKS

Coil Receiving & Splitting STALLED WORK	216 loads
work goes quiet partway through and never finishes	\$2,879
Inbound P2P Transfer Processing MISSED FOLLOW-UPS	194 loads
the “New Barlow Invoice” email never went out	\$2,586
Coil Receiving & Splitting EXCESS BACK-AND-FORTH	56 loads
far more emails per order than the peer norm	\$1,887
Everything else the audit flagged	60 instances
6 further checks, detailed in the live view	\$2,540

9 exception checks evaluated against Ironvale Group's own workflows · dollar figures carry their assumptions (see “How we compute this”)

216 loads have gone quiet in the middle of the process in Coil Receiving & Splitting — no activity far past the usual rhythm

Work goes quiet partway through and never finishes — 216 loads in the window, priced at **\$2,879**. (assumes ~20 min of ops time per item at \$40/hr — an estimate you can adjust.)

Order LMP-00399 quiet for **58 days**, never finished "CFS ASN "

Order 2970465B quiet for **59 days**, never finished "Re: Beckley WV to Crofton IL"

Order LMP-00375 quiet for **59 days**, never finished "Re: Beckley WV to Crofton IL"

NEW Barlow Invoice LMP-00399

Rowan Verlaine · May 23, 2026

Hello, Attached is an invoice for load LMP-00399. Please let us know if you have any questions. Thank you, Alex Marlow Ironvale Group...

Quimby Marlow Industries LLC - Beckley of Lading No: 12773 - Release Number: IVG-20260512-002

riley.delmont@stonebridge-supply-co.com · May 20, 2026

Hi, Attaching Beckley of Lading # 12773. Release Number: IVG-20260512-002. Manifest Number: . Thanks!...

Ironvale Group Release LMP-00399

Skyler Barlow · May 17, 2026

Hi Oakden, I hope you are doing well. Please release the attached load for FWF to pickup this week. Thanks, Clearwater Industrial...

Three of the 553 email threads behind this number. Every figure in this report clicks down to the actual thread — you can check our work, and when we're wrong, the audit gets smarter.

THE RHYTHM, DRAWN — THE "NEW BARLOW INVOICE" EMAIL ACROSS 570 LOADS IN SCOPE

■ **376** sent — usually ~26h, slowest 10% 49h ■ **194** never sent at all

How a miss is counted: this check fires when the expected send hasn't happened 2x past the team's own median of ~26h, within the last 30 days. Before any miss renders here, the mailbox is re-checked — a send that landed since removes the claim.

THE NUMBERS THAT SURPRISED US

Every tile is computed from this business's own history — the thresholds and formulas are stated, check by check, in the methodology appendix.

194 loads never got the team's own "New Barlow Invoice" email after Received — usually out within ~26h

194 loads · est. **\$2,586** in the window — assumes ~20 min of ops time per item at \$40/hr — an estimate you can adjust

56 loads in Coil Receiving & Splitting took far more back-and-forth than the rest — the usual is ~1 emails per load

56 loads · est. **\$1,887** in the window — assumes ~10 min per extra email touch at \$40/hr — an estimate you can adjust

The audit flagged 6 further checks beyond these — 60 more instances, est. \$2,540 — detailed in the live view.

WHAT TURNS ON AFTER THE AUDIT

- FIRST** **Alerts.** The moment a load slips its usual rhythm, the right person knows — while it's in flight, not in a month-end review. *Your team approves every step.*
- THEN** **Drafted replies.** The follow-up that never went out arrives pre-written, built from how your team actually writes it. A person reads it and clicks send. *Your team approves every step.*
- LATER** **Automation.** Steps that prove themselves in dry runs graduate to running on their own — each with an audit trail back to the evidence. *Your team approves every step.*

The audit is the front door. From there, pariter grows into a 24/7 member of your ops team — catching what slips, drafting what's due, escalating what's stuck, and QA'ing its own work.

APPENDIX — HOW THIS AUDIT IS COMPUTED

- 1

The data. Ironvale Group's email and system of record, connected **read-only** — we can observe, never touch. The corpus behind every claim: **12,981** emails, **17,694** records, **116,089** system events. Every figure in this report resolves to specific rows and threads in that corpus — nothing is sampled, modeled from an industry average, or estimated from a survey.
- 2

Reconstructing how the business runs. From the history alone, we rebuild the real workflows (4 here) as observed step sequences — what follows what, done by whom, with each step's **median and 90th-percentile lag measured from the business's own timestamps**. No templates: if the team's rhythm is 26 hours, the audit's clock is 26 hours.
- 3

Counting the right thing. Records here group into **loads** (the business's own word — confirmed by them, each holding several coils), and the actions the audit watches happen once per load — so every count and price in this report speaks in loads, the unit the business actually acts on. When a unit hasn't been confirmed by the business yet, the report says so and uses a generic noun — **an unconfirmed unit never inflates a claim**.
- 4

Glossary — the processes named in this report, in plain words (each description was written from the business's own history and confirmed on review):

Coil Receiving & Splitting

A two-stage intake process in which incoming steel coils are first logged as received into inventory and then split/Eastvale into sub-coils or narrower strips for downstream processing or order fulfilment.

Inbound P2P Transfer Processing

An end-to-end peer-to-peer (P2P) inbound transfer process that moves material from a ready state through submission, release, pickup scheduling, inbound shipment tracking, and completion, culminating in a received status and generation of a new Barlow invoice.

Outbound Order Fulfillment

a process that moves a steel order from initial proposal through internal approval, release for carrier pickup, physical shipment, and culminates in issuing the Glenrock invoice.

Purchase Order Fulfillment

a two-stage inbound supply process in which a purchase order is first placed with a supplier (ordered) and then goods are confirmed as received into Ironvale Group's inventory (received).
- 5

The checks. 9 deterministic exception checks, derived from the reconstructed workflows (not hand-picked): a follow-up that never went out, back-and-forth beyond the peers' norm, work gone quiet partway through, value sitting unaccounted. Each check's exact fire condition and cost assumption:

CHECK	FIRES WHEN...	FOUND	EST.	COST ASSUMPTION (VERBATIM)
Stalled work Coil Receiving & Splitting	fires when work that started never reached a finishing step and has been quiet 2x longer than the peers' usual gap	216 loads	\$2,879	assumes ~20 min of ops time per item at \$40/hr — an estimate you can adjust
Missed follow-ups Inbound P2P Transfer Processing	fires when the expected send hasn't happened 2x past the team's own median of ~26h, within the last 30 days	194 loads	\$2,586	assumes ~20 min of ops time per item at \$40/hr — an estimate you can adjust
Excess back-and-forth Coil Receiving & Splitting	fires when one order's email count this window beats its peers' 90th percentile (minimum 5); only the last 30 days of email count	56 loads	\$1,887	assumes ~10 min per extra email touch at \$40/hr — an estimate you can adjust
Excess back-and-forth Outbound Order Fulfillment	fires when one order's email count this window beats its peers' 90th percentile (minimum 5); only the last 30 days of email count	32 loads	\$1,240	assumes ~10 min per extra email touch at \$40/hr — an estimate you can adjust

CHECK	FIRES WHEN...	FOUND	EST.	COST ASSUMPTION (VERBATIM)
Excess back-and-forth Purchase Order Fulfillment	fires when one order's email count this window beats its peers' 90th percentile (minimum 5); only the last 30 days of email count	21 loads	\$1,093	assumes ~10 min per extra email touch at \$40/hr — an estimate you can adjust
Excess back-and-forth Inbound P2P Transfer Processing	fires when one order's email count this window beats its peers' 90th percentile (minimum 5); only the last 30 days of email count	2 loads	\$140	assumes ~10 min per extra email touch at \$40/hr — an estimate you can adjust
Stalled work Inbound P2P Transfer Processing	fires when work that started never reached a finishing step and has been quiet 2x longer than the peers' usual gap	3 loads	\$40	assumes ~20 min of ops time per item at \$40/hr — an estimate you can adjust
Stalled work Purchase Order Fulfillment	fires when work that started never reached a finishing step and has been quiet 2x longer than the peers' usual gap	1 load	\$13	assumes ~20 min of ops time per item at \$40/hr — an estimate you can adjust
Stalled work Outbound Order Fulfillment	fires when work that started never reached a finishing step and has been quiet 2x longer than the peers' usual gap	1 load	\$13	assumes ~20 min of ops time per item at \$40/hr — an estimate you can adjust

- 6 Pricing.** Time-cost checks price **instances × minutes × an hourly rate** — the assumption is printed beside every figure and is an estimate the business can adjust, never a black box. Summed: **≈247 hours/month**, inside the team's own stated capacity (5 people) — a time claim that exceeded the team's real hours would be rejected before this report shipped. Annualization: open exposure found in the last 30 days (\$9,892) read as a monthly run-rate × 12. We deliberately do **not** price the business consequence of a miss (an unsent invoice's cash-flow exposure, a lost quote) — that multiplier belongs to the reader.
- 7 Verification.** Three independent honesty mechanisms. (1) **Held-out backtest:** we replay history the model has never seen and ask it to predict the team's next action — current score **94 of 100** (always guessing the most common action scores 85); it re-runs on every retrain. (2) **Live re-check:** before any "never went out" claim renders, we re-check the mailbox — if the send landed since, the claim is suppressed, not shown. (3) **Traceability:** every instance links to the actual email thread behind it, so the work is checkable by the business itself.
- 8 Limitations — read these.** Dollar figures are priced-time estimates under stated assumptions, not measured losses. Email that isn't linked to a record yet doesn't count toward touches (coverage grows as the system confirms identifiers, so early numbers UNDER-count). Findings move as new mail arrives — this is a live audit, not a snapshot. Where the business corrects us, the audit gets smarter; the corrections are part of the product.

See it live on a company like yours — 15 minutes

A working audit on a real (anonymized) business: every number on this page, live, clicking down to the emails behind it. Then decide if you want yours.
